Class 07: Semantic roles and PropBank

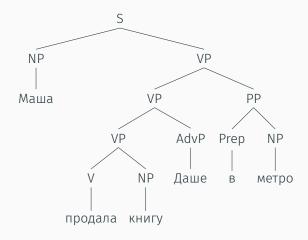

## Introduction

Кто?сделал что?кому?где?Машапродала книгуДашев метроMašasold the bookto Dašaon the metro

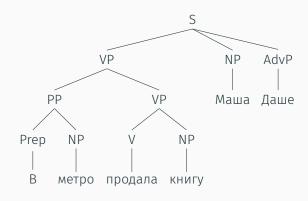

- Что кто-то сделал?
- Кто продал книгу?
- Кому продала Маша книгу?
- Где Маша продала книгу?

- Question answering
  - · Determining if an event corresponds to a question
  - · Event extraction and ontology filling
- Machine translation
  - · Fvaluation: Text coherence
  - · Features for argument structure coherence
    - · Making sure the "who did what to whom" is preserved in the output

# Syntax/1

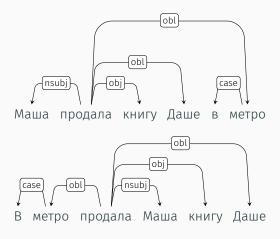

# Syntax/1

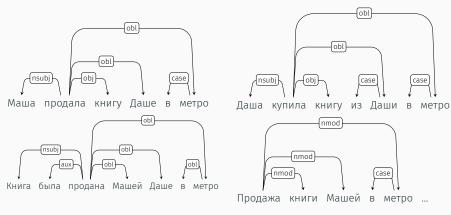

## Syntax/2

Doesn't dependency parsing solve this?

/ı

Could these refer to the same event?

# Shallow representation

Predicates and arguments/roles.

Predicates (like продать, купить) represent an event.

Semantic roles (like Agent, Theme) express the abstract role of the arguments of the predicate.

 $\begin{array}{cccc} \text{Buyer} & \text{Agent} & \text{Proto-Agent} \\ & \leftarrow & \rightarrow \\ \text{More specific} & & \text{More general} \end{array}$ 

# Deep roles

Specific for a predicate,

- · Maša broke the window
- · Saša opened the door

Subjects of break and open: Breaker and Opener

The objects are: BrokenThing and OpenedThing

Hard to reason with for applications

#### But both Breaker and Opener have something in common:

- Volitional actors
- · Often animate
- · Direct causal responsibility for their events

Thematic roles capture this similarity,

- · Breaker and Opener are both AGENTS
  - · Volitional actors with causal responsibility for an event
- BrokenThing and OpenedThing are both THEMES
  - Inanimate objects affected in some way by an action

#### One of the first linguistic models:

- Introduced by the grammarian Pāṇini between the 7th and 4th centuries BCE
- · Called kāraka in Sanskrit/Indo-Aryan linguistics

#### Modern formulation by Fillmore (1966):

- Influenced by Tesnière (1959)'s dependency syntax
- · Called first actants (following Tesnière) and then later case

The terminology is confusing.

Role	Definition				
AGENT	The volitional causer of an event				
EXPERIENCER	The experiencer of an event				
FORCE	Non-volitional causer of an event				
THEME	Participant most directly affected by an event				
INSTRUMENT	An instrument used in an event				
BENEFICIARY	The beneficiary of an event				
SOURCE	Origin of a transfer event				
GOAL	The destination of a transfer event				

Role	Definition
AGENT	The volitional causer of an event
	Маша разбила окно
EXPERIENCER	The experiencer of an event
	Саше болеет голова
FORCE	Non-volitional causer of an event
	Ветер сдувал снег
THEME	Participant most directly affected by an event
	Маша продала <b>книгу</b>
INSTRUMENT	An instrument used in an event
	Она написала письмо ручкой
BENEFICIARY	The beneficiary of an event
	Я купил <b>тебе</b> кофе
SOURCE	Origin of a transfer event
	Ты не приехала <b>из Кызыла?</b>
GOAL	The destination of a transfer event
	Я хочу <b>в Якутск</b>

# Thematic «grid»

#### разбить:

Realisations:

AGENTTHEME

- AGENT/Subject THEME/Object
- AGENT/Subject THEME/Object INSTRUMENT/NP $_{\it ins}$

INSTRUMENT

· тнеме/Subject

Маша	разбила	ОКНО	
AGENT		THEME	
Маша	разбила	ОКНО	молотком
AGENT		THEME	INSTRUMENT
<sup>?</sup> Молоток	разбил	ОКНО	
INSTRUMENT		THEME	
Окно	разбилось		
THEME			
Окно	было	разбито	Машей
THEME			AGENT
Окно	было	разбито	молотком
THEME			INSTRUMENT

#### **Problems**

Very hard to create a standard set of roles or formally define them.

For example for INSTRUMENT,

- intermediary instruments can appear as subjects:
  - · The cook opened the jar with the new gadget
  - · The new gadget opened the jar
- enabling instruments cannot:
  - · They ate rice with chopsticks
  - · \*The chopsticks ate rice

## **Alternatives**

#### PropBank:

Generalised roles defined as prototypes

#### FrameNet:

· Define roles specific to a group of predicates

#### Pause for thought:

- If we want to use this in a practical NLP system, does the label matter or does the distribution matter?
- If we can generalise over different things that look different but refer to the same event (buy, sell; kick, is kicked) does the precise formalism matter?

# PropBank and FrameNet

A **PropBank**<sup>1</sup> is a corpus annotated with predicates and arguments The English PropBank:

- · Annotated on top of the Penn Treebank
- · Not freely available

Uses numbered arguments:

- · Arg0: PROTO-AGENT
- Arg1: PROTO-PATIENT
- · Arg2: BENEFACTIVE, INSTRUMENT, ATTRIBUTE END STATE
- ...

PropBanks exist for: English\*, Chinese\*, Arabic\*, Finnish, Russian?

<sup>&</sup>lt;sup>1</sup>Martha Palmer, Daniel Gildea and Paul Kingsbury (2005) "The Proposition Bank: An Annotated Corpus of Semantic Roles". *Computational Linguistics* 31(1):71–106

## Proto-Agent:2

- · Volitional involvement in event or state
- Sentience (and/or perception)
- · Causes an event or change of state in another participant
- Movement (relative to position of another participant)

#### Proto-Patient:

- Undergoes change of state
- · Causally affected by another participant
- · Stationary relative to movement of another participant

<sup>&</sup>lt;sup>2</sup>David Dowty (1991) "Thematic Proto-Roles and Argument Selection". *Language*, 67(3) pp. 547–619.

There is a special prefix, ArgM-, for modifiers of the predicate:

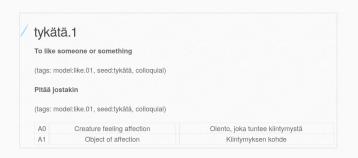

```
ArgM-TMP
           Когда ?
                          yesterday evening, now
    -LOC Где?
                          in the metro, in Moscow
    -DIR Куда?
                          down, to Kyzyl
           Как?
   -MNR
                          clearly, enthusiastically
    -PRP
           Почему?
                          because, in response to the ruling
    -ADV
           Miscellaneous
           II-predication
                          painted the room naked
    -PRD
```

PropBank comes with **frame files** which contain predicates and their argument structure.

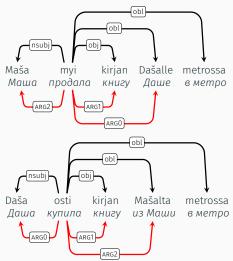

- · Finnish PropBank is freely available
- https://github.com/TurkuNLP/Finnish\_PropBank (data branch)

PropBank comes with **frame files** which contain predicates and their argument structure.

- · Finnish PropBank is freely available
- https://github.com/TurkuNLP/Finnish\_PropBank (data branch)

PropBank-style annotation allows us to see commonalities:

#### Summary:

- A propbank is a corpus annotated with predicate–argument structure
- · Predicate-argument structure generalises over syntax
- There is a free PropBank for Finnish

#### But how about Russian?

- There is a semantically-annotated corpus based on FrameNet
- It could be converted into a PropBank
- · For more info ask Olya Lyashevskaya

## FrameNet/1

#### FrameNet is very popular:

· Semantically-annotated database/electronic resource

It contains (for English):

- · 1,200 frames
- 13,000 lexical units (word–meaning correspondence)
- · 202,000 example sentences

## FrameNet/2

#### Frames:

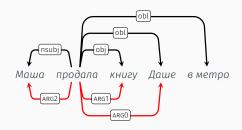

- Conceptual structure involving participants, events and background knowledge
- · Extremely specific, e.g.
  - · Commerce\_goods-transfer
  - Being\_born
  - $\cdot$  Criminal\_process

#### Frame elements:

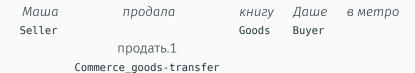

- · Core: essential to the meaning of the Frame
  - Seller, Buyer, Goods
- · Non-core: descriptive, e.g. time, place, manner
  - · Place, Purpose

## vs. PropBank

## PropBank:

#### FrameNet:

Semantic role labelling

# Semantic role labelling

#### A generic algorithm:

```
function SEMANTICROLELABEL(words) returns labeled tree

parse ← PARSE(words)

for each predicate in parse do

for each node in parse do

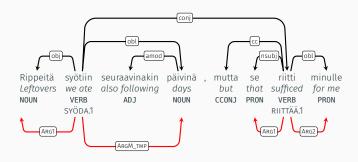

featurevector ← EXTRACTFEATURES(node, predicate, parse)

CLASSIFYNODE(node, featurevector, parse)
```

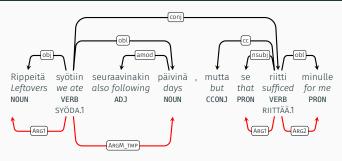

How do we decide what is a predicate?

- PropBank: Use the verbs
- FrameNet: Use what was labelled as such in the training data

#### **Features**

#### **Features**

Headword of constituent	Rippeitä
Headword POS	NOUN
Headword Morph. features	Case=Par
Voice of clause	Active
Linear position (wrt. predicate)	before
Path features	
First and last words in constituent	

# One step or three step

#### One step:

Classify argument type

## Three step:

- Prune unlikely nodes
- · Identify if a node is an argument or not
- · Classify argument type

Why add pruning and identification steps?

# Why add pruning and identification steps?

- · Algorithm is looking at one predicate at a time
- Very few of the nodes in the tree could possible be arguments of that one predicate
- · Imbalance between:
  - (+) positive samples (constituents/nodes that are arguments of predicate)
  - (-) negative samples (constituents/nodes that are not arguments of predicate)
- · Imbalanced data can be hard for many classifiers
- So we prune the very unlikely constituents first, and then use a classifier to get rid of the rest.

## Joint inference/1

#### $\textbf{function} \ \ \textbf{SEMANTICROLELABEL} (words) \ \textbf{returns} \ \ \textbf{labeled tree}$

parse ← PARSE(words)

for each predicate in parse do

for each node in parse do

featurevector ← EXTRACTFEATURES(node, predicate, parse)

CLASSIFYNODE(node, featurevector, parse)

- The algorithm so far classifies everything locally each decision about a constituent is made independently of all others
- But: Lots of global or joint interactions between arguments and constraints
  - · e.g. PropBank does not allow multiple identical arguments, so
  - Labelling one constituent as Arg0 should increase the probability of another being Arg1

## Joint inference/2

#### Reranking:

- The first stage SRL system produces multiple possible labels for each constituent
  - The second stage classifier the best global label for all constituents
  - Often a classifier that takes all the inputs along with other features (sequences of labels)

## Summary

#### Semantic Role Labelling:

- A level of shallow semantics for representing events and their participants
- · Intermediate between parses and full semantics
- Two common architectures, for various languages
  - · FrameNet: frame-specific roles
  - · PropBank: Proto-roles
- Current systems extract by
  - · parsing sentence
  - · Finding predicates in the sentence
  - · For each one, classify each parse tree constituent

#### Practical

#### Option 1:

- Download Finnish PropBank
  - https://github.com/TurkuNLP/Finnish\_PropBank
  - https://github.com/TurkuNLP/Finnish\_PropBank/tree/data
  - · https:

```
// github.com/TurkuNLP/Finnish\_PropBank/tree/data/gen\_lemmas
```

- · Write a semantic role labeller
- Train on train, find good feature combination on dev and test on test.

## Option 2:

- Olya Lyaševskaya has given me a file with semantically annotated sentences for Russian
- Combination of TSV + XML
- Produce something approximating the PropBank style annotation.

#### Data format

Uusi elämä myös tuoksuu uudelta! :)

'New life also smells fresh! :)'

#### .conllu file:

ID	TOKEN	LEM	POS		FEATS	HEAD	DEPREL	DEPRELS	MISC
1	Uusi	_	_	_	_	2	amod	_	_
2	elämä	_	_	_	_	4	nsubj	4:PBArg_1	_
3	myös	_	_	_	_	4	advmod	4:PBArgM_dis	_
4	tuoksuu	_	_	_	_	0	root	_	PBSENSE=tuoksua.1
5	uudelta	_	_	_	_	4	xcomp	4:PBArg_2	_
6	!	_	_	_	_	4	punct	_	_
7	:)	_	_	_	_	4	discourse	_	_

#### .tsv file:

base|number|argnum|definition|note|definition\_fin|note\_fin
tuoksua|1|1|Stinky thing|NULL|Tuoksuva asia|NULL
tuoksua|1|2|Attribute of arg1|NULL|Mille tuoksuu|NULL

#### Combination of TSV + XML

# new FrameAnno<br />
